

These devices have been installed as part of the Lorentz Center Workshop 'Full-stack bioacoustics: field kit to AI to action.' The goal is to monitor wildlife biodiversity by continuously collecting acoustic data beginning on Monday August 1, 2022 and ending on Friday August 5, 2022. We follow General Data Protection Regulation (GDPR) guidelines (<https://gdpr.eu/>). Any data collected will either be deleted by the end of the workshop on August 5, 2022, or will be filtered to remove human sounds before being stored on a server where only the workshop participants have access for a maximum of 6 months (until February 5, 2023).
